Table 2. Holdings-based portfolio architecture channels

Channel	Portfolio-level construction	Economic mechanism	Expected pattern
Internal financial capacity	Mean of z(ROA) and z(cash ratio)	Internal funding and shock-absorption capacity	Potentially protective; sign tested
External financing dependence	z(external-finance dependence)	Sensitivity to capital-market access and refinancing	Negative under joint CPU–market stress
Growth-duration exposure	Mean of z(capex intensity), z(R&D intensity), z(revenue	Distant cash flows, innovation, and investment timing	Persistent negative recovery after extreme CPU
Portfolio concentration	Mean of z(HHI), z(top-ten weight), −z(effective number	Limited diversification and dominant-holding exposure	Negative amplification
Financial architecture risk	Mean of −capacity, external finance, growth-duration	Combined financial vulnerability	Conditional
Extended architecture risk	Financial risk plus concentration	Combined financial and diversification risk	Conditional

Note. Components are standardized with 2025Q4 main-quality parameters and applied unchanged to earlier snapshots. At least two components are required for growth-duration and financial risk; at least three for extended risk.
