

Table A2. Temporally aligned growth-duration robustness, 2020-2025

Horizon	Coefficient	Percentage-point differential	Panel-HAC p-value	Comparison with full sample
6 months	−0.0548	−5.48	0.0159	Full sample: −4.85
12 months	−0.0633	−6.33	0.0141	Full sample: −5.56

Note. The aligned window preserves the sign and economic magnitude of the principal dynamic result. The shorter sample has less power after adjustment across the 24-test family and is therefore interpreted as a robustness check rather than a replacement for the full-panel estimate.
